Field of Interest: The non-mevalonate, or MEP, pathway for isoprenoid biosynthesis is essential in gram-negative, some gram-positive bacteria, plants, and protozoa making it an attractive pathway to target for antibiotics since mammals use the mevalonate pathway to synthesize isoprenoids. IspF is the fourth step in the pathway and converts diphasocytidyl-2-methylyerythritol 2-phosphate into 2-methylyerythritol 2,4-cyclodiphosphate (cMEPP). IspF inhibitor 1 (compound 3 in Geise et al.) has low micromolar activity (IC_{50} = 6.1-32 µM) against the recombinant enzymes and inhibits the growth of P. falciparum in a red blood cell assay.  

Hazardous Properties and Cautions: The toxicological and pharmacological properties of this compound are not fully known. For further information see the MSDS on request. IspF Inhibitor 1 is manufactured and shipped only in small quantities, intended for research and development in a laboratory utilizing prudent procedures for handling chemicals of unknown toxicity, under the supervision of persons technically qualified to evaluate potential risks and authorized to enforce appropriate health and safety measures. As with all research chemicals, precautions should be taken to avoid unnecessary exposures or risks.
